The screenshot shows the Kaggle competition host evaluation page. The left sidebar contains navigation links: Home, Compete, Data, Notebooks, Discuss, Courses, Jobs, and More. The main content area is titled 'Host Controls' and includes sections for Settings, Images, Privacy, Manage Hosts, Evaluation, and All Submissions. The 'Evaluation' section is highlighted with a red box. It contains a 'Scoring Metric' dropdown menu set to 'RMSE Root Mean Squared Error'. Below this is a 'Solution File' upload area with a red box around the upload icon. A file named '2020.AI.bike-solution.csv (3 kB)' is listed. At the bottom, there is a 'Solution Mapping' table with columns 'Solution Column' and 'Expected Column'. The table has two rows: 'id' mapped to 'Id (String)' and 'count' mapped to 'Expected (Double)'. A 'Public Leaderboard' section shows 'percentage' as 100. A 'Set Solution Mapping' button is at the bottom right.

All Submissions Launch Checklist

User submissions are evaluated by comparing their **Submission CSV** to the ground truth **Solution CSV** with respect to a chosen **Scoring Metric**, for example the Root-mean-squared Error (RMSE) metric.

Each **Scoring Metric** will expect the Solution and Submission CSVs to have certain columns, defined in a header row. For example, RMSE expects an **Id** column identifying the row and an **Expected** column specifying the true value which competitors are attempting to predict. Your Solution CSV's header row does not need to use the exact column names, you will be able to map your column names onto the Metric's expected columns.

To ensure that competitors cannot game the system, the rows in the solution file are sampled into **Public** and **Private** rows. Public scores are shown on the public leaderboard, while only the private scores are used to determine the competition winner. The sampling can be done manually by including a **Usage** column with values of **Public**, **Private**, or **Ignored**. Otherwise, rows will automatically be sampled into these buckets.

Data Description

Edit

This page shows up underneath the data files. Here you describe what files you have provided and the format of each. There is no single format for this page that is appropriate for all competitions, but you should strive to describe as much as you can here. A little time spent describing the data here can save a lot of time answering questions later.

Participants should be able to answer questions like these after reading the data description: What files do I need? What should I expect the data format to be? What am I predicting? What acronyms will I encounter?

File descriptions

- train.csv - the training set
- test.csv - the test set

Overview

Description

Evaluation

+ Add Page

The evaluation pages describes how submissions will be scored and how students should format their submissions. You don't need a sub-title at the top (the page title appears above). For an example of a high-quality evaluation page, see the 2013 KDD Cup page, which we have copied here:

The evaluation metric for this competition is **Mean F1-Score**. The F1 score, commonly used in information retrieval, measures accuracy using the statistics precision p and recall r . Precision is the ratio of true positives (tp) to all predicted positives ($tp + fp$). Recall is the ratio of true positives to all actual positives ($tp + fn$). The F1 score is given by:
$$F1 = 2 \frac{p \cdot r}{p + r} \text{ where } p = \frac{tp}{tp + fp}, r = \frac{tp}{tp + fn}$$

The F1 metric weights recall and precision equally, and a good retrieval algorithm will maximize both precision and recall simultaneously. Thus, moderately good performance on both will be favored over extremely good performance on one and poor performance on the other.

Submission Format

For every author in the dataset, submission files should contain two columns: AuthorId and DuplicateAuthorIds. DuplicateAuthorIds should be a space-delimited list. Every AuthorId counts as his/her own duplicate, and every duplicate should be listed under each of its respective ids. For example, if you suspect author A, B, and C are the same, you should list (A,A,B,C), (B,B,A,C), (C,C,A,B). The file should contain a header and have the following format:

```
AuthorId,DuplicateAuthorIds
```
